

Guidelines for Nap and Rest (Toddlers and Preschoolers)

Prepared by Sarah Myers, RN, Health & Safety Specialist at Child Care Aware of ND

Follow these guidelines to create a healthy and safe environment for nap and rest:

- Licensing requirements - <https://www.hhs.nd.gov/cfs/early-childhood-services/child-care-licensing>
- Bright & Early participants - learn about ERS at <https://ersi.info/>

Location

- If possible, keep children in the same area on the same floor (main floor is preferable) to make an evacuation easier/faster in an emergency. This also helps with supervision.
- If using a room/area only used for napping (ex. spare bedroom, porch). Make sure it is a comfortable temperature and free from drafts. Portable heaters are potential fire and burn hazards.
- Designate a specific place/location for each child. Children feel more secure if they have the same spot to sleep each day. If a child falls asleep in another location while playing (such as the cozy area), it is recommended to move the child to his/her nap place and place on his/her own nap items.

Lighting

- Dim the lights or close the blinds but keep enough light to allow for supervision and for safety.

Noise

- If playing music or using a sound machine, keep volume low. Make sure you can hear children at all times.

Childproof Room

- Make sure hazards are out of reach or locked away if an adult is not always present in the room to supervise.

Sleeping Surface

- Use a cot/mat or washable barrier such as a sleeping bag, blanket, bathmat, large beach towel, etc.
 - Children cannot sleep directly on the floor
- If an elevated surface (ex. couch or adult bed) is used for sleep, make sure the child is developmentally ready to sleep on an elevated surface to prevent an injury. Cover the area with a removable washable barrier such as a sheet and provide an individual pillow with a removable pillowcase for laundering.
- If bunk beds are used, the top bunk should not be used by children under 6 years old. If the bottom bunk is used, remove the ladder to the top bunk if possible, or consider the child's behavior (ex. would the child try to climb the ladder to the top bunk when not supervised?).

Sheets and Barriers

- Provide a washable material as a barrier on a mat/cot for comfort. Options: fitted crib sheet; sheets made for cots/mats; king size pillowcase works as a sleeve over a mat.
 - It is recommended for the washable material cover to stay in place on the cot/mat.
- Sheets on cots can be left on the cots if they do not touch another child's cot when stacking.

Purchasing Nap Mats

- Choose nap mats that are "PVC free"
- Don't purchase nap mats that have flame retardants
- Avoid purchasing nap mats that are labeled "Meets Technical Bulletin 117"
- Avoid nap mats that contain antimicrobials
- If mats are torn, it is recommended to replace them. Exposed foam can collect germs or can be a safety hazard for those under 3 years of age.

Purchasing cots

- Plastic frame is safer than a metal frame and easier to clean.
- Frame should be stable.
- Check plastic frames for cracks - cover sharp edges/cracks with duct tape until cot can be replaced.
- Check metal frames for pinching hazard or sharp edges – cover sharp edges with duct tape until cot can be replaced.

Cleaning of Sleeping Surfaces/Linens

- Mats/cots – clean with soap and water weekly if labeled or before it is used by another child. Disinfection is required if soiled with body fluids.
- Blankets, pillowcases, sheets, sleeping bags, bathmats, beach towels, etc. – launder weekly or sooner if soiled.
 - Launder or change between children.

Selection of Nap Items

- Allow children to bring special nap items from home – helps to provide comfort/security.
- Do not allow children to sleep in sleep sacks if they are over 12 months and out of a crib/playpen.
- Limit the amount of nap items that each child can bring (ex. one stuffed toy, one blanket, one pillow).
- Limit the size of the items (ex. travel size pillow instead of standard size pillow or body pillow).
- Pillows must be washable or have a removable case.
- Limit the size of blanket (ex. one small blanket instead of large quilt/comforter).
- Do not allow weighted blankets without a written order from a health care provider.

Storage of nap items

- Store each child's nap items separately. Options for separate storage: XL Ziploc bags, vinyl pillowcases, plastic containers, cubbies.
- Nap items can be stored on cots if the nap items are fully enclosed in a bag (preferably plastic) or vinyl pillowcase.

Space between children when napping:

- Separate by 3 feet or a solid barrier (ex. low shelf).
- If solid barrier is used, the provider must have easy access to the child and must be able to supervise. Also consider the safety of the barrier. The AAP does not recommend the use of screens as a solid barrier.
- It is not recommended to stack items (ex. chairs) on top of shelves/tables next to children during nap.
- If not able to provide 3 feet of space, space as far as possible and alternate children head to feet.
 - 18" minimum to 3 feet (preferred) between children or a solid barrier that is tall enough so that if a child sits up, they can't see over the barrier.

Supervision:

- If an adult cannot remain in room or area with children, use an infant monitor and conduct regular visual checks.
 - Children must be within hearing or vision at all times.
 - Visually check children every 10-15 min
 - Supervision should be pleasant, responsive, and warm. Help children to relax if needed (ex. rub/pat back gently, sit by child).
 - Children's heads should always be uncovered. Do not cover children's heads with their blankets.

Scheduling naps

- Naps are recommended to be scheduled appropriately. Naps should also be flexible to meet each child's need. When a child is tired, the child should be able to nap instead of keeping the child up until the scheduled nap time for all children.
 - Napping schedules are set according to the children's ages and needs.
- For children who do not nap or for those who are early risers, it is recommended to allow those children to participate in quiet activities instead of requiring them to remain on their sleeping surface for the entirety of the nap time.
